# Full Course CD - Exploring Creation With Marine Biology

## Synopsis

The Exploring Creation With Marine Biology Full Course CD-Rom is a high school, college preparatory multimedia course. This version of the course has all of the information found in the print version, PLUS multimedia add-ons such as animations, videos (which do not replace lab experiments), narrations and audio pronunciation guides. The student reads the text from the screen and follows links to multimedia enhancements. It is not a supplement. It is a FULL COURSE! It runs in Internet Explorer, which is included on the CD. The course looks just like a website, which makes it very familiar to most students. There is a navigation frame to the left which allows you to choose any module and any section of the course. The content of that portion of the course will then appear on the right-hand frame. There are animations and videos throughout the course, which make the material fun and interesting. Technical words are also pronounced for the student. There are instructions for conducting hands-on experiments throughout the CD so that the student can have a true laboratory-based marine biology course. You can purchase a kit of materials so that these experiments can be done either at home or in a school setting. There are study guides and tests for every module in the course, and the answers are provided as well. Located on a separate CD that is included with the course, these materials can be printed out so that the student can use them and the parent/teacher can grade them.

This is the second Apologia science book. They are great. The material is intense. This curriculum is for advanced students. Average students may struggle. Below average students will be extremely challenged.

Thanks!

Love the pictures

This is the book used in a home school cooperative that my daughter participates in. If you want materials that exclude evolutionary process as an origin, this book will work for you. However, it does not appear to espouse the gap understanding of the Biblical creation narrative either ( I have not read it cover to cover, but skimmed through it) It is a good introductory study of the subject matter that is likely to spawn additional outside research by the curious student.

This marine biology textbook is easy to read and understand. It builds on the previous science courses and build on the concepts. These concepts are explained so you can understand it even if you haven't been exposed to them previously!!

This book was so enjoyable for my 15yr old son, he was able to gather facts and still enjoy the reading material without it becoming boring half way through the book
