# Scientific Computing With MATLAB And Octave (Texts In Computational Science And Engineering)

## Synopsis

This textbook is an introduction to Scientific Computing, in which several numerical methods for the computer-based solution of certain classes of mathematical problems are illustrated. The authors show how to compute the zeros, the extrema, and the integrals of continuous functions, solve linear systems, approximate functions using polynomials and construct accurate approximations for the solution of ordinary and partial differential equations. To make the format concrete and appealing, the programming environments Matlab and Octave are adopted as faithful companions. The book contains the solutions to several problems posed in exercises and examples, often originating from important applications. At the end of each chapter, a specific section is devoted to subjects which were not addressed in the book and contains bibliographical references for a more comprehensive treatment of the material. From the review: "... This carefully written textbook, the third English edition, contains substantial new developments on the numerical solution of differential equations. It is typeset in a two-color design and is written in a style suited for readers who have mathematics, a natural sciences, computer sciences or economics as a background and who are interested in a well-organized introduction to the subject." Roberto Plato (Siegen), Zentralblatt MATH 1205.65002.

## Book Information

Series: Texts in Computational Science and Engineering (Book 2)

Hardcover: 450 pages

Publisher: Springer; 4th ed. 2014 edition (February 21, 2014)

Language: English

ISBN-10: 364245366X

ISBN-13: 978-3642453663

Product Dimensions: 6.4 x 0.9 x 9.3 inches

Shipping Weight: 1.8 pounds (View shipping rates and policies)

Average Customer Review: 3.2 out of 5 stars 2 customer reviews

Best Sellers Rank: #826,973 in Books (See Top 100 in Books) #117 in Books > Science &

Math > Mathematics > Applied > Graph Theory #165 in Books > Science & Math >

Mathematics > Pure Mathematics > Combinatorics #258 in Books > Textbooks > Computer

Science > Artificial Intelligence

## Customer Reviews

This textbook is an introduction to Scientific Computing, in which several numerical methods for the

computer-based solution of certain classes of mathematical problems are illustrated. The authors show how to compute the zeros, the extrema, and the integrals of continuous functions, solve linear systems, approximate functions using polynomials and construct accurate approximations for the solution of ordinary and partial differential equations. To make the format concrete and appealing, the programming environments Matlab and Octave are adopted as faithful companions. The book contains the solutions to several problems posed in exercises and examples, often originating from important applications. At the end of each chapter, a specific section is devoted to subjects which were not addressed in the book and contains bibliographical references for a more comprehensive treatment of the material. From the review: "... This carefully written textbook, the third English edition, contains substantial new developments on the numerical solution of differential equations. It is typeset in a two-color design and is written in a style suited for readers who have mathematics, natural sciences, computer sciences or economics as a background and who are interested in a well-organized introduction to the subject." Roberto Plato (Siegen), Zentralblatt MATH 1205.65002

Alfio Quarteroni is Professor and Director of MATHICSE at EPFL, Lausanne (Switzerland), and Professor and Director of MOX at the Politecnico di Milano (Italy). Author of 20 books (mostly published with Springer) and of more than 200 papers, he is actually one of the strongest and reliable mathematicians in the world in the field of Modelling and SC. Fausto Saleri was Professor of Numerical Analysis at Politecnico di Milano (Italy) until 2007. Author of 11 books published with Springer, he worked on the approximation of partial differential equations, giving important contributions to the study of shallow water equations and to the development of scientific software libraries for finite elements. Paola Gervasio is Associate Professor of Numerical Analysis at University of Brescia (Italy) since 2005. Her research work focuses on the approximation of partial differential equations by spectral methods and domain decomposition techniques.

This book is wonderfully constructed but is absolute garbage in terms of material. I had just finished a course on C programming and was excited to get started with matlab. There just wasn't anything useful here though. A perfect example is most of the examples in the book are just a question and the answer if you're lucky. No explanations... no step by step instructions, no troubleshooting for the programming. Just awful

This book is not for people that think will learn how to add two numbers  $1+1$ . It really requires you have a good sense of calculus and it is not for newbies at all. In general is a very good book!
